Providence, RI. December 5, 2005

Visionary Systems, the developer of the MediComm System, is helping doctors' offices increase efficiency by streamlining practice workflow and patient management. This easy to use system features a central display panel with an overview of the entire office, and modules at each exam room to allow quick data entry and focused information display. MediComm represents a significant improvement over conventional plastic flag or blinking light room status systems.

Already in use in several states, the system is saving time and money. "Our goal was to be efficient and to ensure that patient flow was continuous. The results have exceeded our expectations," says Norma Morrison, Director of Operations at Foundry Sports Medicine and Fitness in Providence, RI.

Doctors, nurses, and staff instantly know who is in the waiting room, how long they have been there, and if they have completed appropriate paperwork. Doctors know which exam room to go to next, be it to consult with a new patient or revisit a patient whose x-rays are now ready. Doctors can make detailed nurse calls from each exam room, which remain on the central display until they are acted upon. MediComm increases margins because doctors spend minimal time in the hallway.

Dr. Leroy Schroeder, who manages his practice in Ohio, says, "Because of the efficiency with the patients and staff, we feel that it saves us at least 1-2 people per shift, a definite cost savings."

The MediComm system effectively compliments current medical office systems.

- Know at a glance which exam rooms are free for quick assignment.
- Optionally display the patient name outside the exam room - essential for EMR offices.
- Doctors know which rooms have patients and the order in which to serve them.
- Doctors can easily request a nurse, tech service, or procedure with enough detail so that the staff member arrives with the necessary supplies.
- Provide an intuitive, visual display, eliminating annoying auditory pages.
- Coordinate the front desk, nurse's station, transcriptionists, and care providers into a synchronized team.
- Integrate with existing scheduling and practice management systems.
- Instantly grasp how busy the office is and where the bottlenecks are.
- Collect data for detailed practice analysis and reports.
